AI Developer Infrastructure Checklist

Host your API, workers and application data on a server you control. Check model and accelerator requirements before choosing a plan.

What to check

Application requirements

List the runtime, packages, APIs and background workers your application uses. Confirm any GPU requirement before ordering; a VPS plan does not imply a GPU.

Data and credentials

Separate model files, customer data, databases and API keys. Decide what must be backed up and who can access it.

Resource budget

Measure memory and CPU use on representative jobs. Include storage, external API charges and backups in the operating budget.

Deployment and recovery

Test service restarts and a restore from backup. Keep a deployment record so you can rebuild the application on another server.

Services to compare

Check the linked product pages for current prices, included resources, availability and terms.

VPS

Self-managed virtual servers with administrator access. Check current resources, licence costs and backup requirements.

Dedicated

A physical server quoted to your application, storage and networking requirements.

Backups

SFTP storage for your backup software. Confirm physical separation when the source is also at DotMoose.

Domains

Register, transfer and renew domains, and manage the DNS records used by your website and email.

Plan the next steps

1. Choose a VPS for the current application requirements
2. Move heavy or sustained workloads to dedicated hardware
3. Keep domains, hosting, servers, and backups under one provider
4. Plan migration and recovery before production depends on the stack

Your project notes

Keep this page with your project. Do not write passwords, private keys or other secrets here.

Project / website	
Software and data	
Service / full ongoing cost	
Account owner / administrator	
Backup location / restore test	
Move or launch date / rollback plan
